

Modal windows will appear breaking the users from their flow, to provide critical information or ask for a decision. Modals disable the entire UI until the action is confirmed; this way the users can absorb the information they need to proceed or fully understand their actions. Due to its interruptive nature, modals should be only used when matching this criteria. Do not use to show error, success, or warning messages. Keep those messages on the page using alerts & notifications.

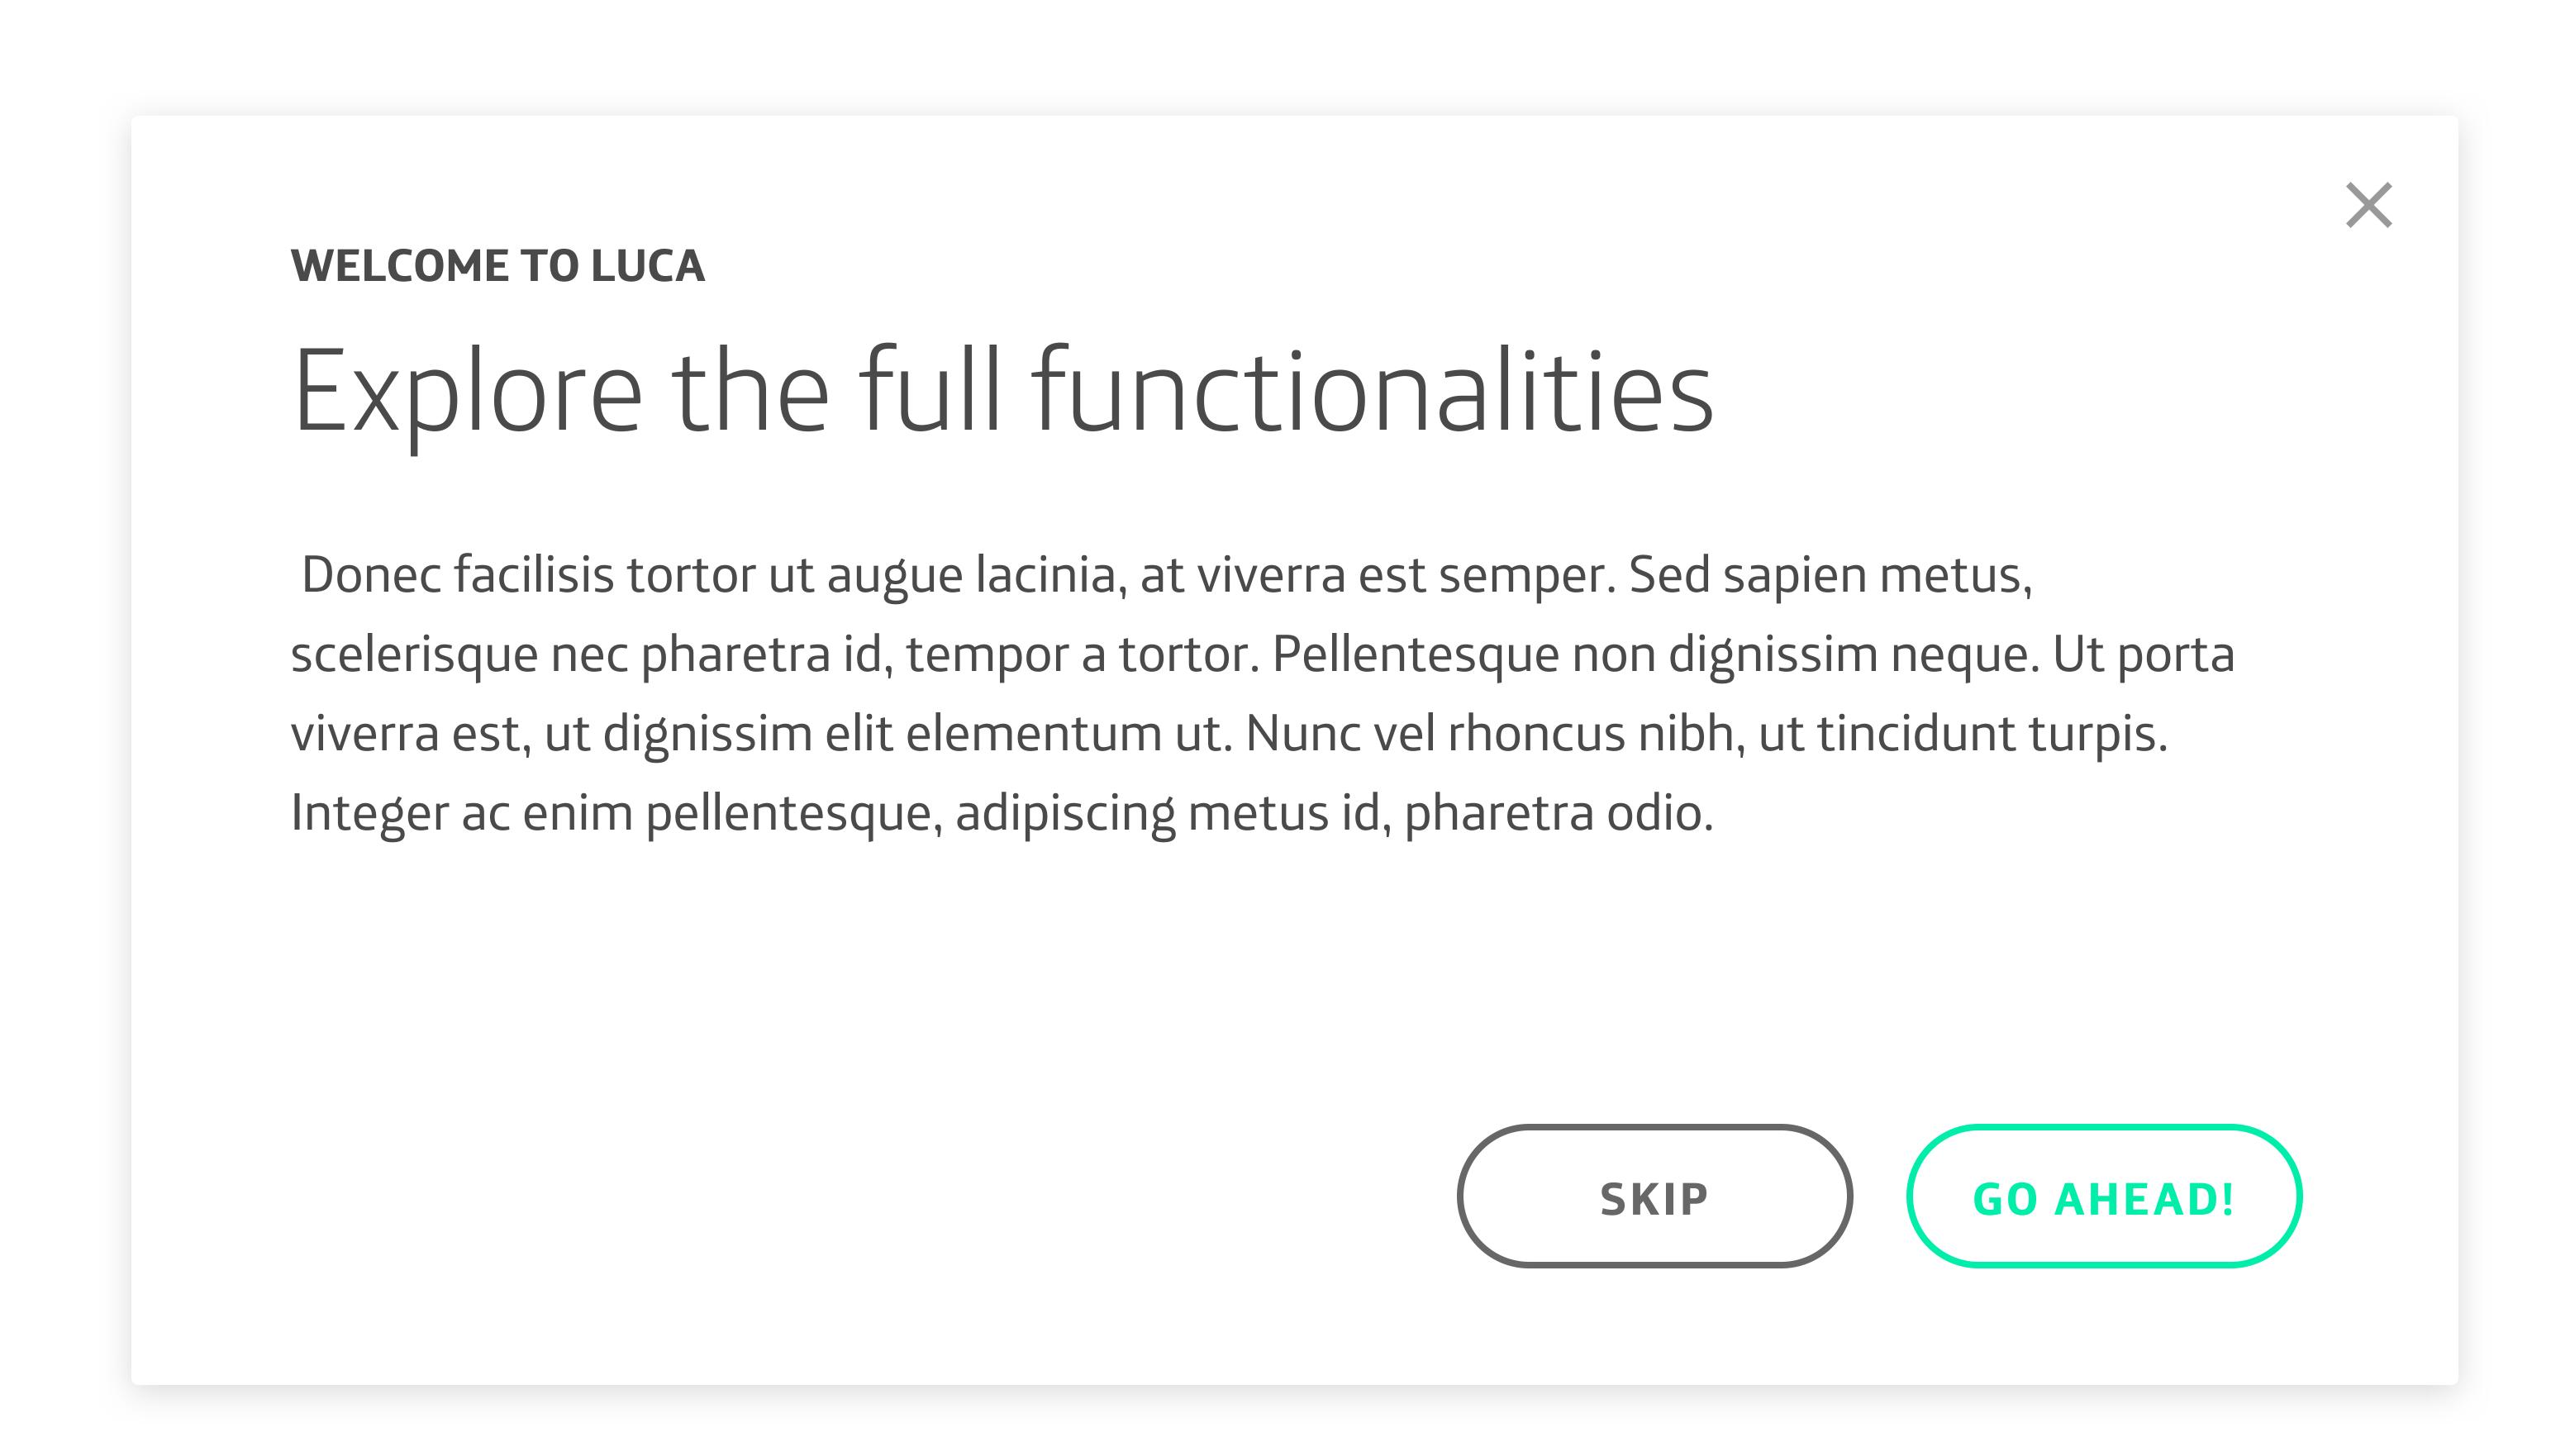

Informational Modal

They provide platform information and error messages. They are useful in onboardings, explaining certain aspects that the user may not be familiar with. If the information provided is subject to be repeatded we can included a don't show again checkbox component.

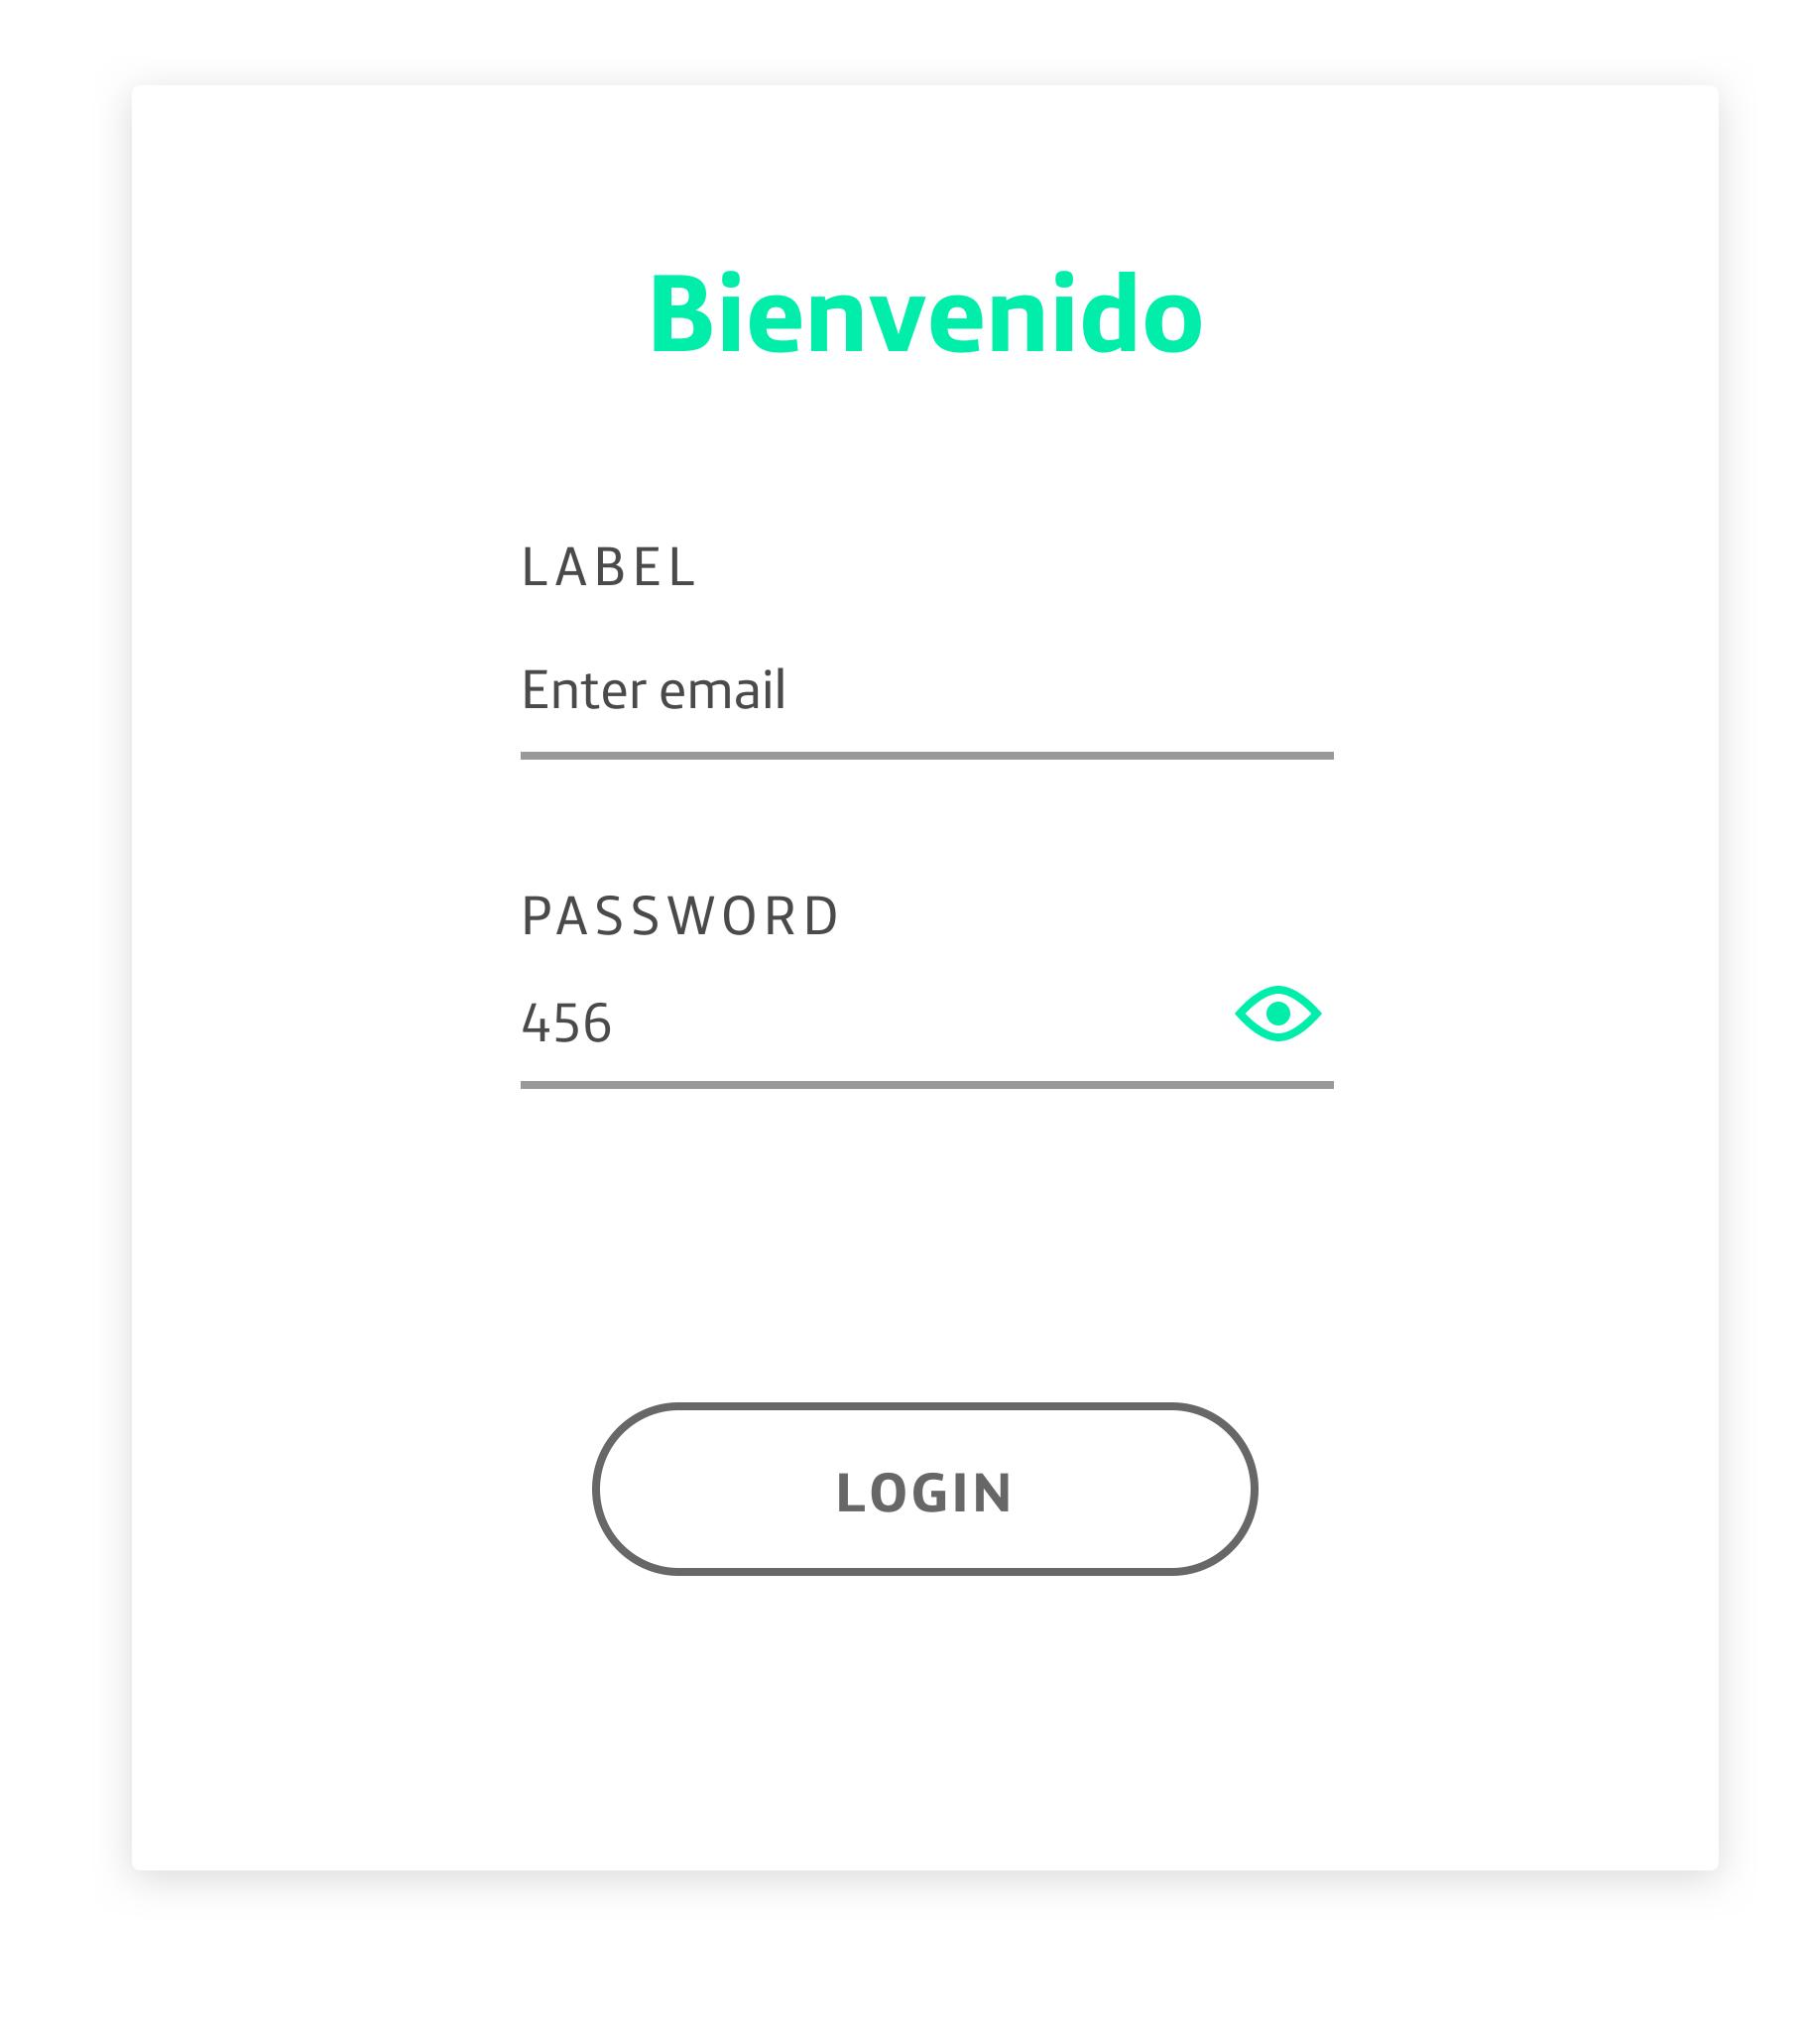

Transactional

It is used when the user needs to make a deliberate choice, asking the user to make a decision that will affect any future actions within the application, like agreeing to terms and conditions before continuing or deleting any kind of data.

Input Modal

It is used when the user needs to make a deliberate choice, asking the user to make a decision that will affect any future actions within the application, like agreeing to terms

Setting Modal

It is used when the user needs to make a deliberate choice, asking the user to make a decision that will affect any future actions within the application, like agreeing to terms
