DROPDOWN

Dropdown lets users choose options (one in case of dropdown) or various options (in case of multiselect dropdown) from a list in a menu. It works well for lists of more than four choices when displaying them could clutter up the interface. The select component should:

- List items within the menu alphabetically or some other logical order so users can easily find the selection they need.
- Provide a label to clearly identify the content being presented in the drop down menu.
- Have a default option selected, where possible.
- Have a placeholder option with the text "Select" if there is no logical default option.
- In case of choosing various options, when the dropdown is fold, it indicates the number of selected items.
